²Final Year PG Scholar, Department of PG Studies in Panchakarma, JSS Ayurveda Medical College, Mysuru, Karnataka, India.

ABSTRACT

Hypoxic-ischemic encephalopathy (HIE), is one of the most frequent and dramatic urgency found in neurological brain diseases of adults. This is a neuro-vascular and neuro-metabolic syndrome, caused by a shortage of supply of oxygen and glucose or their metabolism in the brain. HIE results from a global hypoperfusion or oxygenation deficiency rather than from infarction in a specific vascular cerebral territory. In adults, common etiologies include hypotension, cardiac arrest followed by successful resuscitation. Here is a case study of 66-year-old female patient presenting with complaints of BalaKshaya and KarmaKshaya in Ubbaya Urdhwa and Adhoshaka associated with Vak Krichrata since 2 weeks. Current case was diagnosed as Hypoxic Ischemic Encephalopathy in conventional medicine and emergency management was done. Based on the presenting complaints of the patient, in Ayurveda it can be understood in lines with Sarvagaro / Vepathu Vata / Kapha Avrutha Vyana and treatment was planned accordingly. Panchakarma therapies along with oral medications for 21 days has given the best result to the patient in terms of reduction of clinical features and also quality of life.

Key words: HIE, Hypoxic-ischemic encephalopathy, Sarvagaro, Vepathu Vata, Kapha Avrutha Vyana, Ayurveda.

INTRODUCTION

Hypoxic–ischemic encephalopathy, is a severe consequence of global cerebral ischemia due to cardiac arrest or other causes like hanging, strangulation, poisoning with carbon monoxide or near-drowning. Cardiac diseases are the main cause of cardiac arrests (82.4%) and subsequent brain damage. In the United States, approximately 180,000-450,000 people (in Europe about 270,000 people) are dying because of sudden cardiac death per year.¹

Cerebral hypoxia can be classified according to severity and location²

- **Diffuse cerebral hypoxia**: mild to moderate impairment of global brain function caused by low levels of oxygen in the blood.
- **Focal cerebral ischemia**: a localized and temporary reduction of brain tissue oxygenation. Neuronal damage is usually reversible. Ex: TIA.
- **Cerebral infarction**: a long-term blockage of blood flow to a region of the brain. Significant irreversible damage occurring in the area after obstruction.
- **Global cerebral ischemia**: a complete and diffuse stop of blood flow to the brain (e.g. severe systemic hypotension in shock, cardio-respiratory arrest).

Depending on the cause of the reduction of oxygen to the brain, cerebral hypoxia may be: hypoxic, hypemic / anaemic, ischemic and hystotoxic.

Neurophysiology³

The brain needs 3.3 ml O2/100g/min and 8 mg glucose/100g/min under basal cerebral condition at a
blood flow to an average of 55 ml/100g/min (i.e. 750 ml/min) representing 15-20% of total cardiac output at rest. Blood flow of gray substance (cortex) is 4-5 times higher (70-80 ml/100g/min) than that of white matter (15-20 ml/100g/min). In people over 60 years, cerebral blood flow is 30-40 ml/100g/min.

**Neurophysiopathology**\[^4,5\]

In case of reduction of O2 concentration in the blood, the body respond to compensate by redirecting systemic blood flow and increasing cerebral blood flow, up to 2 times normal. If this change is sufficient to meet the brain needs of O2, then symptoms characteristic of hypo / anoxia of brain does not appear. If the adaptive response of O2 deficit is not corrected, the symptoms begin to appear.

The most common causes of acute cerebral hypoxia is the dropping of cerebral perfusion (global cerebral ischemia) caused by cardio-respiratory arrest and severe hypotension (haemodynamic shock). Sustained severe hypoglycaemia, sustained seizures (status epilepticus) over 1-2 hours may also cause permanent brain damage. Global cerebral ischemia is more aggressive, because in addition to the energy shortage there will be accumulation of lactic acid and free radicals, which are removed during normal blood flow conditions as they accumulate.

**Symptoms and signs of cerebral hypoxia**\[^6,7\]

Depending on the duration of cerebral hypoxia the following clinical events are observed,

<table>
<thead>
<tr>
<th>Duration of hypoxia</th>
<th>Clinical signs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 1 minute</td>
<td>Unconsciousness, convulsions, miosis, abolished pupillary reflex</td>
</tr>
<tr>
<td>After 2 minutes</td>
<td>Mydriasis, the abolition of corneal reflex</td>
</tr>
<tr>
<td>After 5 minutes</td>
<td>Cerebral cortex suffering irreversible damage</td>
</tr>
<tr>
<td>After 15 minutes</td>
<td>Irreversible damage at brain stem and the spinal cord</td>
</tr>
</tbody>
</table>

**Post hypoxic neurological syndromes**

They are: coma or persistent vegetative state, dementia, extrapyramidal syndrome (parkinsonian) with cognitive deficit (in CO poisoning), coreoathetosis, cerebellar ataxia, myoclonus, Korsakoff’s disease. If injuries are caused by global ischemic hypoperfusion, the patient may present specific manifestations of watershed strokes (border zone): visual agnosia (Balint’s syndrome or cortical blindness) when the lesion is between the territories of MCA and PCA, proximal upper limb motor deficit, sometimes to the leg when damage is located between MCA and ACA territories.

As per Ayurveda classics this can be correlated with **Sarvangaroga** which is explained in the context of **Pakshaghata. Pakshaghata** is a Vatavyadhi involving **Karmakshaya** and **Blakshaya** in Ardhashareera along with loss of speech i.e., one half of the body, whereas **Sarvangaroga** is that which involves **Sarvashareera** i.e., whole body is involved in the pathology.\[^8\] Present case depicts the involvement of **Kaphavrutha Vyana Samprapti** and thereby treatment was planned accordingly.

**CASE DESCRIPTION**

A female patient aged 66 years approached OPD of Panchakarma Department of JSS Ayurveda Hospital on 12/8/2023 with the complaints of **Balakshaya** and **Karmakshaya** in **Ubhaya Urdhwa** and **Adhoshaka** associated with **Vak Krichrata** since 2 weeks and was diagnosed as a case of Hypoxic Ischemic Encephalopathy and was treated in ICU for 12 days.

**History**

On 30th of July 2023 around 10.30pm, she suddenly started experiencing breathlessness, palpitation, associated with chest pain radiating to left upper limb and cough. She was being rushed to Allopathic Hospital, and on the way to the hospital she developed loss of consciousness and CPR was performed and then immediately she was shifted to ICU and was treated for cardiac arrest. While in ICU on 4th day, patient developed loss of speech and on the next day she had jerky movements in Left hand and later in both the
hands and face with deviation of mouth to right side along with head tremors. Later after treatment the jerky movements was reduced but the patient developed weakness and loss of strength in all the 4 extremities and was unable to walk, drowsiness, cough with breathlessness was observed and was diagnosed as Hypoxic Ischemic Encephalopathy and was treated for the same and later patient was discharged from the hospital after 2 weeks with no further improvement. So she approached JSS Ayurveda Medical Hospital for further management. A female patient aged 66 years is a K/C/O Chronic Rheumatic heart disease since 5 years, Hypertension since 10 years, T-2 Diabetes mellitus since 10 years, Prolapsed intervertebral disc since 1 month and under medication for all the co-morbidities. The patient also complains of pain in lower back region and b/l knees with stiffness since 1 month.

**Personal History**

- **Diet** - Ryle’s tube feeding.
- **Sleep** - Always drowsy.
- **Bowel** - Constipated.
- **Micturition** - Catheterized.

**General Examination**

- **BP** - 130/90mm Hg
- **PR** - 78 bpm
- **RR** - 21 times/min
- **Height** - 156 cm
- **Weight** - 68 kgs
- **Nourishment** - Moderate

**Ashta Sthana Pariksha**

- **Nadi** - 78bpm
- **Mala** - Constipated
- **Mutra** - Catheterized
- **Jhva** - Lipta
- **Shabda** - Vikrutha
- **Sparsha** - Anushnasheeta
- **Drik** - Prakrutha

**Systemic Examination**

- **Gastro-intestinal systems** appear normal.

**Respiratory Examination**

- **O/I** : Shape of chest : B/l symmetrical.
- **O/A** : B/L Ronchi - (+)
  - B/L Basal crepitations (+)

**Musculoskeletal Examination**

- **O/E of Knee joints**
  - **O/I** : No swelling, No deformity, No scar, No redness.
  - **O/P** : Tenderness : Present b/l.
  - Temperature : Locally raised b/l.
  - Crepitus : (+) b/l.

- **O/E of Lumbar spine**
  - **O/I** : No swelling, No deformity, No scar, No redness.
  - **O/P** : Tenderness : Present at L3-4, L4-5.
  - Temperature : Locally raised.
  - SLR : Negative.
  - Bregard’s : Negative.
  - ROM : Bedridden.
Nervous System Examination

Higher Mental Function
Consciousness - Well Conscious.
Orientation - Well oriented to time, place and person
Behaviour - Cooperative
Attentiveness - Drowsy
Memory - Immediate - intact
  Recent - intact
  Remote - intact

Cranial Nerve Examination

Olfactory Nerve - Intact.
Optic Nerve - Intact.
Oculomotor Nerve - Intact.
Trochlear Nerve - Intact.
Abducent Nerve - Intact.
Trigeminal Nerve - Intact.
Facial Nerve -
  Forehead Furrowing - Intact
  Eyebrow raising – Intact
  Eye closure – Intact
  Teeth showing - Slight deviation to right side.
  Blowing of cheeks  - Not possible in Rt.Side.
Vestibulo Cochlear Nerve - Intact.
Glossopharyngeal & Vagus Nerve - Deglutition : Hampered.

Spinal Accessory Nerve

Shrugging the Shoulders - Not elicited
Hypoglossal Nerve - Dysarthria - Present

Co-ordination Test

Finger to nose test - Not elicited.
Heal shin test - Not elicited.

Sensory Examination

Superficial pain - Intact
Light touch - Intact
Temperature sensation - Intact
Vibration sensation - Intact
Joint position sense - Intact
Stereognosis - Intact
Graphhestesia - Intact

Motor System Examination

GAIT : Bedridden initially.
Ataxic (After 1 week of treatment while she started walking).
Tropical changes : No bed sores.
Atrophy in muscles of hands & legs : Absent
Fasciculation & irritability : Absent
Contraction & contractures : Absent
Involuntary movements : Tremors : Present
Intentional tremors : Present in left hand
Resting tremors : Present in left hand and head.

Muscle Tone :
Rigid - slight Clasp knife rigidity in Lt. upper limb.
Normotonic in Right limb.

Muscle Bulk : Intact.

Muscle Power :

RESULTS

Subjective improvements

1. Patient was bedridden initially and after treatment was able to walk with minimal support.
2. Patient muscle power got improved.
3. Tremors got reduced.
4. Patient mood became happy and cheerful.

DISCUSSION

Hypoxic-ischemic encephalopathy (HIE) is a brain disorder resulting from inadequate blood and oxygen supply due to various causes. HIE most commonly occurs in neonates, also known as neonatal hypoxic-ischemic encephalopathy (NHIE), with perinatal asphyxia as the main cause. During the perinatal period, umbilical cord entanglement or abnormal amniotic fluid can cause fetal distress, asphyxia, and hypoxia. Non-NHIE can be seen in severe cerebral hypoxia-ischemia (HI) from a variety of causes, including shock, respiratory and cardiac arrest, carbon monoxide poisoning, myasthenia gravis, and persistent status of epilepticus. Meanwhile, tissue damage has been observed in the cerebral cortex, hippocampus (Hipp), striatum (STR), and thalamus (TH), as well as the subcortical and periventricular white matter injury (WMI) has been found.[9]

This Hypoxic Ischemic encephalopathy can be considered as Cluster of features in Ayurveda.
It can be paralleled with Sarvangaroga explained by Acharya Charaka as Karmakshaya of all 4 limbs in this Patient was present. This indicates that the Cerebrum got affected with Hypoxia resulting in features of Pyramidal tract involvement.

The head tremors and Resting tremors of left hand along with myoclonic jerks at ICU indicates involvement of Extra-pyramidal system with Hypoxia. This can be related to Vepatu Vata/ Kampa Vata.

Intentional tremors, loss of co-ordination with Ataxic gait while she started walking after 10 days of treatment indicates the involvement of Cerebellum with Hypoxia. This can be paralleled with Kapha- Ama and Vata.

The present case depicts Samprapthi of Kapha Ama Vrutha Vyanan and treatment was planned accordingly i.e., Kapha Avarana and Ama associated with the Vata at this acute stage should be removed initially and later Kevala Vata Chikitsa should be done. Initially to start with Kapha Avarana and Ama Vrutha Vyana was performed. While treating the Avarana one should always keep Vata under Anulomana and hence Tab. Anuloma DS was administered during that period which does Vataanulomana as well as Koshta Shodhana. During this the patient was relieved from drowsiness and muscle power of limbs got improved and tremors got reduced. Patient mood became cheerful and happy and patient was able to sit without support. As swallowing got improved Ryle’s tube was removed and totally oral feeding was started.

After the Ruksha and Ushna Chikitsa for Kapha and Ama later Vata Shamana treatment was adopted by performing Sarvanga Abhyanga and Nadi Sweda with Ksheerabala Taila which is Vata-Kapha Hara and after this the patient started gaining strength and confidence and patient was able to stand with support during this period.

Later Brimhana line of management was followed by adopting Sarvanga Shastika Shali Pinda Sweda which is a Snigdha Sankara Sweda and is Brimhana in nature and Matrabasti was administered with Dhanwantara Ghrita which is Vatahara Brimhana and equal quantity of Sukumara Ghrita which contains Eranda Taila helps in Vataanulomana. After this treatment patient was able to walk with minimal support speech was also improved.

Janu Uponaha with Eranda Taila and Saindhava Lavana was performed for both the knees which helped in relieving pain and stiffness.

Rasaraja Rasa mainly contains Shuddha Parada, Abhraka Satva, Swarna Bhasma, Loha Bhasma, Rajata Bhasma and Vanga Bhasma and is indicated in Pakshaghata, Arditha, Apanantraka and Sarva Vatavyadhi and is Balya and Vrushya.

Jayamangala Rasa includes Shuddha Parada, Shuddha Gandhaka, Tankana Bhasma, Tamra Bhasma, Vanga Bhasma, Makshika Bhasma, Swarna Bhasma, Loha Bhasma, Rajata Bhasma, Dhattura, Nirgundi and Kiratatikta and is indicated in all types of Jwara, Aparna Jwara, Vishama Jwara, Mamsa, Medha and Ash蒂 Gata Vata Vyadhis and is Sarvaroga Nivaraka. As the condition is acute with major role of Ama, Jayamangala Rasa was administered.

Shwasakaschintamani Rasa contains Shuddha Parada, Shuddha Gandhaka, Swarna Bhasma, Loha Bhasma, Makshika Bhasma, Swarna Bhasma, Mukta Bhasma, Abraka Bhasma, Kantakari, Yastimadhu, Nagavalli and goats milk. This balances Vata-kapha Doshha and is indicated in Shwasa, Kasa, Dushta Pratishyaya. As the Patient had Kasa and Shwasa / breathlessness even for minimum exertion this was administered.

CONCLUSION

This case study demonstrates successful management of Hypoxic Ischemic Encephalopathy w.r.t. to Sarvangaroga with features of Kapha Ama and Vepatu Vata / Kampavata in Ayurveda. These Panchakarma therapies along with Shamanoushadi has given best result in the reduction of all signs and symptoms. Patient was bedridden at the time of admission but was able to walk with minimal support. This case report serves as a lead for further treatment and researches in the management of Hypoxic ischemic encephalopathy in Ayurveda.
